

Hiring with AI

Madison Byrd

CSCE 581

Biplav Srivastava

April 30, 2026

1 Methodology

The metrics I'm choosing are leadership, AI technical experience, AI ethics experience, interdisciplinary collaboration, and institutional impact.

prompt:

"make a job description for Chief AI Officer at the University of South Carolina. Next, look for five USC staff on sc.edu with AI in their descriptions. Choose one of them for the job. Weigh them on five metrics: leadership, AI technical experience, AI ethics experience, interdisciplinary collaboration, and institutional impact."

2 Job Description

a) Job Description (Chief Artificial Intelligence Officer)

Role: Chief Artificial Intelligence Officer (CAIO)

Organization: University of South Carolina

Position Summary:

The Chief Artificial Intelligence Officer (CAIO) leads the strategic adoption, governance, and innovation of artificial intelligence across the university. The CAIO ensures AI is used to enhance research, teaching, operations, and public engagement while maintaining ethical, secure, and equitable practices.

Key Responsibilities:

- Develop and implement a university-wide AI strategy
- Promote AI research and interdisciplinary collaboration
- Establish ethical AI governance frameworks (bias, privacy, transparency)
- Oversee AI-related infrastructure and partnerships
- Support AI integration into curriculum and student success initiatives
- Advise leadership on AI risks, opportunities, and investments

Qualifications:

- Advanced degree in AI, Computer Science, or related field
- Demonstrated leadership in AI initiatives
- Experience with AI governance and ethics
- Strong collaboration and communication skills

4 Conclusion

The LLM chose Amit Sheth to hire for the position, scoring him a 24 out of 25. The guy already has a leadership role for AI at the university, so this fits pretty well onto reality in my opinion.

The ethical considerations here are that the decision was made exclusively AI, so this decision may not necessarily reflect the context in which this hire is being made, and that it hasn't met any of these people on a personal level.

Some decent part of this methodology is that the decision was made without the AI knowing the race, gender, age etc of the candidates so that can't factor in unfairly as easily if those factors were included. The ramifications of making a bad choice could be funds what weren't used well, a bad candidate being hired, or damaging of trust if it gets out that AI was used to make the decision.
